Properties

Detecting
parameter
heterogeneity

as shown by Strobl et al. (2015):

- ▶ no alpha inflation
 - ▶ correct distributions for optimally selected statistics, closed testing procedure, Bonferroni adjustment
 - ▶ even in the presence of ability differences due to CML
- ▶ higher power than the LR test to detect DIF
 - ▶ in numeric variables (where the true cutpoint is unknown/misspecified)
 - ▶ for other non-standard groups (formed, e.g., by interaction or u-shaped patterns)

for BT models

for Rasch models

for non-Rasch models

Can we trust the
results?

Stability

Effect size stopping

Summary

References

Summary

- ▶ What I have talked about: (package: `psychotree`)
model-based recursive partitioning can
 - ▶ detect groups of observations with different parameters
 - ▶ need not be specified a priori (data-driven, exploratory)
 - ▶ can be used to detect DIF and DSF
 - ▶ can we trust the results?
 - ▶ stability assessment (package: `stablelearner`)
 - ▶ effect-size-based stopping (currently on github.com/mirka-henninger)
